POWER RAILS GLITCH NOISE INSENSITIVE CHARGE PUMP

Abstract

5

A the charge pump suitable for use in phase-locked loop (PLL) circuits employed by mixed signal integrated circuits (IC) is disclosed. The PLL charge pump includes a constant current source that generates constant current source references with high power supply rejection for the P- and N-channel devices of the charge pump. Pass-gate transistors are inserted between the output terminals and the drains of the respective P- and N-channel devices. The switching transients power supply and ground are confined to the turn on/off leads of the pass-gate transistors and, thus, are isolated from the constant current source P- and N-channel devices. In exemplary embodiments of the invention, the constant current of the P- and N-channel devices may be made programmable and used for controlling the range of the current controlled oscillator of the PLL circuit.
